"SARx Rescue literally saved my little bunny when he fell into the throws of GI Stasis. He didn't want to eat or drink, was losing weight and had no interest in anything, including bananas. Rescue saved his life by helping to hydrate him and quickly helped him gain interest in food and water again. Rescue was easily mixed with metoclopramide from his vet and coupled with the Recovery food was just what he needed to beat GI Stasis. I keep a full packet on hand just in case he starts to not feel well. I can't say enough good things about it!"

SHERWOOD
 Pet Health

Digestive health, G.I. tract motility, energy, and appetite are all closely related to each other. If one declines then the others will decline too.

Providing support in each of these areas can give your pet the gift of a healthy life.

Be Prepared with an Emergency Kit

Made for Each Species - PLUS Weight Gain Formulas

Motility: In small herbivores this means stimulating the muscles of the ceacum to contract/relax so that it mixes the contents (dietary fiber) in the ceacum thereby supporting the growth of healthy bacteria.

Your pet may need your help to eat during times of digestive stasis, poor appetite, poor health, illness or surgery.

IF YOUR PET WON'T EAT...

Help Stimulate Their Appetite with SARx Rescue

QUICKLY RESTORES APPETITE
Fast Absorption - No Digestion Needed

The SARx Rescue powder provides vital nutrients that are rapidly absorbed and will help to stimulate the appetite and help your pet feel better.

YOUR PET MAY NEED YOUR HELP TO EAT

Use SARx Recovery Food to Clean Out their Digestive Tract

Other Brands of Recovery Food use Grain & Soy by-products

SARx
Small Animal Recovery[™]

If STASIS catches you by surprise SARx recovery food will help clean out the ceacum and support the growth of beneficial bacteria. This will reestablish beneficial fermentation patterns that get rid of gas, bloating, and mushy poops. You can then transition them to a normal diet of hay and pellets.
You can help them to be healthier and hoppier again.
